

PHASE 1 | Months 1–3 (July – September 2026)

Plan Purchase — Consultations & Lab Partner

Design Requirements

- Design consultation plan listing and detail screens.
- Design plan purchase and payment flow.
- Design active plan dashboard showing plan status, renewal date, and consultation history.
- Design nutritionist profile and onboarding experience after purchase.
- Design user journey for WhatsApp consultation initiation.
- Design health profile section showing nutrition plan summaries and recommendations generated from Bio AI reports.

Tech Requirements

- Build consultation plan management module.
- Integrate payment gateway for plan purchases.
- Build plan subscription and renewal tracking.
- Integrate WhatsApp onboarding workflow after successful purchase.
- Build a nutritionist assignment mechanism.
- Enable sharing of the user's Bio AI report with the assigned nutritionist.
- Store consultation notes, recommendations, and nutrition plan summaries in the user's profile.
- Build a dashboard to track active plans, consultation history, and plan status.

Expected Outcome

A user should be able to:

1. Browse consultation plans.
2. Purchase a plan.
3. Get connected to a nutritionist via WhatsApp.
4. Have their Bio AI report available to the nutritionist.
5. Receive personalized guidance.
6. View plan details, history, and recommendations inside the app.

Lab Partner — Existing Capabilities

Design Requirements

- Enhance the lab partner listing and selection experience.
- Design lab partner cards displaying ratings, lab information, and explainer videos.
- Design phlebotomist tracking experience using Google Maps.
- Improve booking confirmation, reminder, and report-ready notification journeys.
- Enhance report viewing and health timeline experience.
- Create a more trustworthy and informative lab selection flow.

Tech Requirements

- Integrate Orange Health and Tata 1mg as additional lab partners.
- Enable fetching and displaying ratings for lab partners.
- Integrate YouTube video embedding within lab partner profiles.
- Integrate Google Maps for phlebotomist live tracking.
- Build automated notification workflows for booking confirmation, reminders, sample collection updates, and report availability.
- Ensure reports from all lab partners continue syncing automatically to the user's health timeline.
- Improve backend handling of lab availability, booking status, and report tracking.

Expected Outcome

A user should be able to:

1. Compare multiple lab partners.
2. View ratings and learn more about each lab before booking.
3. Book a test with their preferred lab.
4. Track the phlebotomist in real time.
5. Receive automated updates throughout the journey.
6. Access reports seamlessly in the app once available.

ABHA Integration — Ayushman Bharat Health Account

4.1 What is ABHA?

The Ayushman Bharat Health Account (ABHA) is a 14-digit digital health ID issued under India's Ayushman Bharat Digital Mission (ABDM). It serves as a single, portable health record identifier that links a citizen's medical history — prescriptions, diagnostics, hospital visits, and wellness data — across all healthcare providers.

- Issued by NHA (National Health Authority) — Government of India
- Enables consent-based sharing of health records between providers
- Recognised across ABDM-compliant hospitals, labs, and health platforms

4.2 ABHA Integration Features

Digital Health ID Linking

- Allow users to create or link their existing ABHA ID within the Supershyft app
- Map Supershyft health data (Bio AI reports, blood work, nutrition plans, consultation history) to the user's ABHA-linked health record
- Consent management — users control what data is shared with which provider
- Verify ABHA ID via OTP-based Aadhaar or mobile authentication (ABDM-standard flow)

ABHA Integration

Objective:

Allow users to link their ABHA Health ID with Supershyft so health records can be securely shared across hospitals, labs, and healthcare providers, while enabling future hospital, insurance, corporate, and government partnerships.

Design Requirements

- Design ABHA onboarding and awareness screens explaining benefits to users.
- Design ABHA creation and linking flow.
- Design OTP verification flow.
- Design consent management screens where users can control what health data is shared and with whom.

- Design linked health records and data-sharing history screens.
- Design hospital booking flow for preventive health checkups.
- Design health timeline showing records synced from hospitals and other healthcare providers.

Tech Requirements

- Integrate ABDM/ABHA APIs for ABHA creation, linking, and verification.
- Build secure ABHA authentication and OTP verification flow.
- Enable syncing of Bio AI reports, blood reports, consultation history, and nutrition plans with ABHA records.
- Build consent management system for health data sharing.
- Integrate hospital partner booking capabilities.
- Enable automatic syncing of hospital reports into Supershyft and ABHA records.
- Implement FHIR R4 standards for healthcare data exchange.
- Ensure DPDP compliance, encryption, and secure data storage and sharing.

Expected Outcome

A user should be able to:

1. Create or link an ABHA ID within Supershyft.
2. Control how their health information is shared.
3. Book preventive checkups with partner hospitals.
4. View all health records in one place.
5. Have reports automatically synced between Supershyft, hospitals, and ABHA.

In Simple Terms

This phase is mainly about **connecting Supershyft to India's digital health ecosystem, enabling secure health record sharing, hospital integrations, and building the compliance foundation required for future insurance, corporate, and government healthcare partnerships.**

PHASE 2 | Months 4–6 (October – December 2026)

Wearable Integration & Superclub

Wearable Integration

Objective:

Connect wearable devices with Supershyft to automatically collect lifestyle and activity data, enrich Bio AI reports, and generate more personalized health insights and recommendations.

Design Requirements

- Design wearable connection and onboarding flow.
- Design device management screen showing connected devices and sync status.
- Design health activity dashboard displaying key metrics like calories, sleep, heart rate, HRV, recovery, and VO2 Max.
- Design insight cards that connect wearable data with Bio AI findings and recommendations.
- Design alerts and nudges based on wearable trends and health goals.
- Ensure wearable data is presented in a simple and actionable format for users.

Tech Requirements

- Integrate Apple HealthKit and Google Health Connect.
- Integrate wearable APIs such as WHOOP, Oura, Garmin, Fitbit, Polar, and Apple Watch.
- Build a wearable data sync and storage system.
- Create a unified data normalization layer so data from different devices follows the same format.
- Map wearable metrics to Bio AI reports and health insights.
- Enable regular syncing and updating of wearable data.
- Build backend services for processing, analysing, and displaying wearable data.

Expected Outcome

A user should be able to:

1. Connect their wearable device to Supershyft.
2. Automatically sync health and activity data.
3. View daily lifestyle metrics within the app.
4. Receive personalized insights based on wearable data and blood reports.
5. Track improvements in health, recovery, fitness, and lifestyle habits over time.

In Simple Terms

This phase is about **bringing wearable data into Supershyft, combining it with Bio AI insights, and giving users a more complete view of their health through real-time lifestyle tracking and personalized recommendations.**

Superclub

Objective:

Create a community-driven wellness platform where users can participate in activities, challenges, and group events, while connecting their participation data to wearable insights and Bio AI recommendations.

Design Requirements

- Design Superclub home and discovery experience.
- Design activity and event listing pages for fitness classes, sports, and challenges.
- Design group creation and group management flows.
- Design leaderboards, rankings, and activity streak tracking.
- Design community engagement features such as joining groups and viewing challenge progress.
- Design personalized nudges, achievement badges, and milestone celebrations.
- Design health insight screens that connect Superclub participation with wearable data and Bio AI outcomes.

Tech Requirements

- Build Superclub activity and event management module.
- Build group creation, joining, and management functionality.
- Build challenge and leaderboard system.
- Enable wearable data syncing with Superclub activities.
- Track user participation, streaks, and challenge completion.
- Connect Superclub activity data with Bio AI insights and recommendations.
- Build automated engagement nudges and reminders.
- Trigger blood test reminders based on predefined activity consistency milestones.

Expected Outcome

A user should be able to:

1. Discover and join fitness activities, sports, and wellness challenges.
2. Create or join groups within their company or community.

3. Participate in challenges and track progress through leaderboards.
4. Automatically sync activity data from their wearable device.
5. Receive personalized health insights and recommendations based on their activity patterns.
6. Get reminders for follow-up blood work after maintaining consistent healthy habits.

In Simple Terms

This phase is about **building a wellness community ecosystem where users stay engaged through activities, challenges, and social accountability, while converting that activity data into meaningful health insights and encouraging long-term healthy behavior.**

Holistic Health Ecosystem & Insurance Readiness

Objective:

Build an **AI-powered healthcare marketplace** that connects users with the most relevant healthcare professional based on their health data, while creating a structured health ecosystem that can support insurance partnerships.

Design Requirements

Practitioner Marketplace

- Design practitioner discovery and recommendation experience.
- Design practitioner listing and profile pages.
- Design booking and consultation journeys.
- Design AI-powered recommendation cards explaining why a practitioner is being suggested.
- Design consultation history and practitioner management screens.

Disease Risk Dashboard

- Design personalized disease risk score dashboard.
- Design risk category visualizations (metabolic, cardiovascular, hormonal, mental health).
- Design health insights and action recommendation screens.
- Design practitioner recommendation flow based on risk scores.

Insurance Readiness

- Design structured health summary reports.
 - Design insurance-ready health record and consultation history views.
 - Design white-label friendly layouts for future insurer partnerships.
-

Tech Requirements

Practitioner Marketplace

- Build marketplace for trainers, nutritionists, therapists, ayurvedic consultants, and specialist doctors.

- Integrate external practitioner networks such as Alpha Coach and hospital partners.
- Build appointment booking and practitioner management system.
- Enable AI-based practitioner recommendations.

AI Disease Risk Engine

- Build disease risk scoring engine using blood reports, wearable data, lifestyle information, and family history.
- Generate personalized risk scores across key health categories.
- Auto-recommend practitioners, nutrition plans, and interventions based on risk profiles.
- Integrate AI outputs into the user dashboard and recommendation system.

Insurance Enablement

- Create structured health records combining blood reports, risk scores, consultation history, and ABHA-linked data.
 - Build insurance-ready reporting framework.
 - Enable future OPD and insurance partner integrations.
 - Support white-label deployment for insurance companies.
-

Expected Outcome

A user should be able to:

1. View their personalized disease risk scores.
 2. Understand potential health risks and recommended actions.
 3. Discover and book the most relevant healthcare professional.
 4. Receive AI-driven health guidance based on their complete health profile.
 5. Maintain a structured health record that can be used for insurance and preventive healthcare programs.
-

In Simple Terms

This phase is about **building an AI-driven healthcare marketplace where Supershyft acts like a health navigator—analyzing user data, identifying health risks, recommending the right expert, and creating a complete health record that can later support insurance partnerships and preventive healthcare programs.**

PHASE 4 (PARALLEL) | Months 7–12 (January – June 2027)

7. Curaa — AI Health Assistant

Objective:

Build a personalized AI health companion that continuously understands a user's health data, answers health-related questions, provides recommendations, tracks progress, and proactively guides users toward better health outcomes.

Design Requirements

Curaa v1

- Design **AI chat assistant experience**.
- Design personalized health summary and health insights screens.
- Design daily check-in and conversational interaction flows.
- Design recommendation cards for nutrition, sleep, hydration, recovery, and lifestyle improvements.
- Design alerts and notification experiences when health metrics change significantly.
- Design conversational prompts for collecting lifestyle updates from users.
- Design AI-generated action plans and progress tracking views.

Curaa v2

- Design meal photo upload and analysis experience.
- Design nutrition breakdown and food feedback screens.
- Design personalized grocery recommendation and shopping list screens.
- Design one-click shopping experience for quick-commerce partners.
- Design medication, supplement, meal, and blood test reminder experiences.

Tech Requirements

Curaa v1

- **Build AI assistant and conversational chat framework.**
- Connect AI with all available user health data sources including:
 - Blood reports and Bio AI outputs
 - Wearable data
 - Disease risk scores
 - Nutrition logs

- Consultation records
- ABHA-linked health records
- Build personalized recommendation engine.
- Build daily nudge and notification system.
- Enable health-based alerts when key metrics move outside expected ranges.
- Create a unified health profile for AI decision-making.

Curaa v2

- Build meal image recognition and nutrition analysis capability.
- Generate personalized grocery recommendations based on nutrition plans and meal history.
- Integrate with Blinkit, Zepto, and Swiggy Instamart for quick-commerce ordering.
- Build smart reminder system for medications, supplements, meals, hydration, and blood tests.
- Improve AI personalization using accumulated user behaviour and health data.

Expected Outcome

A user should be able to:

1. Ask health-related questions and receive personalized responses.
2. Get daily health guidance based on their reports and lifestyle data.
3. Receive proactive reminders and health recommendations.
4. Upload meal photos and receive nutritional feedback.
5. Get personalized grocery suggestions.
6. Track and improve health through a single AI-powered health companion.

In Simple Terms

This phase is about **building Curaa as a personal AI health coach that knows the user's blood reports, wearable data, consultations, nutrition habits, and health risks, and uses that information to provide personalized guidance, recommendations, reminders, and health support every day.**

8. Parallel Development — Smart Scale & HNI Lab Features

Smart Scale & HNI Advanced Diagnostics

Objective:

Expand Supershyft's health ecosystem by integrating smart body composition tracking and advanced diagnostic tests, enabling deeper health insights and premium health services for HNI users.

8.1 Smart Weighing Scale Integration

Design Requirements

- Design **smart scale device connection and onboarding flow**.
- Design Body Composition dashboard and health summary cards.
- Design weight, BMI, body fat, and body composition trend visualizations.
- Design integration of body composition insights within Bio AI reports and health dashboard.
- Design progress tracking and goal monitoring experiences.

Tech Requirements

- Integrate Supershyft smart scale using Bluetooth LE or device SDK.
- Build device pairing and data syncing functionality.
- Enable automatic syncing of weight, BMI, and body composition metrics.
- Integrate scale data into Fitness Summary, Anthropometry Reports, and Bio AI insights.
- Build Body Composition section within the user dashboard.
- Store and visualize historical body composition data and trends.

Expected Outcome

A user should be able to:

1. Connect their smart scale with Supershyft.
2. Automatically sync body composition data.
3. Track weight and body metrics over time.

4. View personalized insights based on body composition changes.

In Simple Terms

This feature is about **bringing body composition tracking into Supershyft and using it to enhance health insights, progress tracking, and fitness recommendations.**

8.2 HNI Advanced Diagnostics

Design Requirements

- Design Advanced Diagnostics section within the app.
- Design test discovery and booking experience for premium diagnostic tests.
- Design detailed diagnostic report views for genetic testing, CT scans, echocardiograms, and food intolerance tests.
- Design advanced health risk visualizations and personalized recommendations.
- Design premium HNI health summary and insight experiences.
- Design integration of advanced diagnostic insights into Curaa AI.

Tech Requirements

- Integrate partner labs and diagnostic providers for advanced testing.
- Build **Advanced** Diagnostics module within the app.
- Enable storage and display of advanced diagnostic reports.
- Integrate genetic testing and diagnostic outputs into Bio AI and Curaa AI systems.
- Build data pipelines to receive analysis from Metflux and display results within Supershyft.
- Generate personalized recommendations based on advanced diagnostic findings.
- Support premium reporting and HNI-specific health insights.

Expected Outcome

A user should be able to:

1. Access and book advanced diagnostic tests.
2. View detailed reports and risk assessments.
3. Receive personalized recommendations based on advanced diagnostics.
4. Get enhanced AI insights through Curaa using genetic and diagnostic data.

In Simple Terms

This feature is about **creating a premium health diagnostics ecosystem where advanced tests such as genetic testing, CT scans, cardiac assessments, and food intolerance tests can be managed within Supershyft and used to deliver deeper, highly personalized health insights for HNI users.**
